

Longevity & Value Proposition of “Dynamic” Equipment Refurbishment Program

With the implementation of the first fully functional, oilfield-focused refurbishment program in the Bakken; customers will see a value-added increase in the longevity and durability of their customer property. The increase in the longevity and viability of customer property, especially in the case of valves is not only pure cost savings over the life of the equipment but also a strong hedge against the turmoil in shipping domestically and supply chain bottlenecks internationally.

A Bakken First Approach

3 PHASE PROCEDURE WAS CREATED TO COMBAT THE MOST SIGNIFICANT ISSUES THAT REDUCE EQUIPMENT LONGEVITY.

DAMAGE DURING DISASSEMBLY

Use of a caustic soak tank to clear away paint and debris allows for easier disassembly and leads to fewer damaged parts

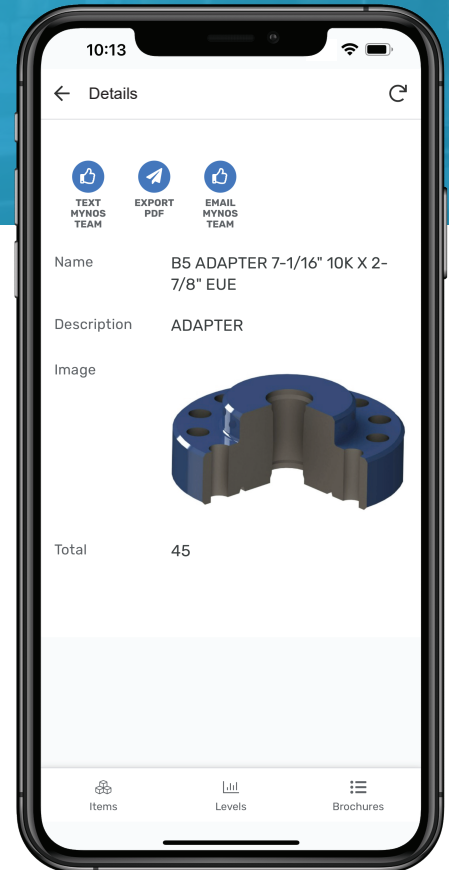

SURFACE AREA IMPERFECTIONS

4 State-of-the-art lapping machine applications allow our in-house team to wipe away small imperfections that would otherwise make your equipment unreliable. Refurbish like new bushings, gates, ring grooves, seat pockets, and more.

CORROSION

Coat your equipment in one of our heated Manganese tanks for ideal protection from the elements. With just one added step we can coat everything in Xylan and use our High-Temperature oven on-site to create a barrier around your equipment that holds up to even the harshest Salt Water Disposal wells.

Northern already stands at the peak of performance in the Bakken with a 98.5% success rate (based on more than 300 frac's completed in the past five years). Transferring this system to your Customer Property Management will triple the expected life of your valves while reducing the cost of replacement or repairs.

Imagine a scenario where your Customer Property is so well maintained that your repair costs drop immediately by 25% and your replacement cost is now extended to double your expected wells. This is a reality with the “Dynamic Equipment” System that Northern has put into place.

Coupled with the only facility like it in the Bakken; NOS launched the MyNOS platform in 2023 allowing you real-time updates on your equipment status and a portal for ordering and managing that most pesky of problems.
